

A scatter plot showing the relationship between Sepal length (cm) on the y-axis and Petal length (cm) on the x-axis. The plot displays three distinct clusters of data points, representing three different species of Iris flowers. The clusters are color-coded: green for the smallest species (Iris setosa), orange for the intermediate species (Iris versicolour), and blue for the largest species (Iris virginica). The x-axis ranges from 0 to 7 cm, and the y-axis ranges from 0 to 8 cm. The green cluster is located at low values for both variables (Petal length < 2 cm, Sepal length < 5 cm). The orange cluster is in the middle range (Petal length 3-5 cm, Sepal length 4-6 cm). The blue cluster is at high values (Petal length > 5 cm, Sepal length > 6 cm). There is very little overlap between the three groups, indicating clear separation between the species based on these two measurements.

- setosa
- versicolor
- virginica
